## Abstract

## A panel study for smokers and its in-depth analysis

## Choi Jongyun, Na Kyoungin

Division of Health Hazard Response, Director General for Health Harzard Response, Korea Disease Control and Prevention Agency (KDCA) Hwang seung-sik
Graduate School of Public Health, Seoul National University

Smoking adversely affects overall health, and is one of the leading causes of adult cancers, such as lung, esophageal, and oral cancer, and of cataracts and diseases such as cardiovascular, respiratory, and infectious diseases. Accordingly, to understand the smoking behavior of adult smokers in Korea and to identify the determinants that affect smoking cessation and re-smoking, an 'Adult Smokers Panel Survey' was conducted from 2015 to 2020 using the 'National Health and Nutrition Survey' of 1,018 adults in Korea. In addition, the characteristics of each factor, such as the change in smoking amount, smoking urge and the frequency of exposure to smoking cessation advertisements of participants, were analyzed during the follow-up surveys conducted over three years (2018-2020) and conducted for two years during the COVID-19 pandemic (2019, 2020). Through these in-depth surveys, the need to prepare a plan to relieve the stress of smokers to improve the induction of smoking cessation and to support a cessation plan for smokers who have not quit smoking was recommended. In particular, the percentage of 'No Attempt to Quit Smoking' increased from 39.4\% to 44.3\% during two years of the COVID19 pandemic (2018-2020). In the future, the need for additional research with a panel of a sufficient number of female smokers and the application of customized medical research through the analysis of individual smoking factors based on biological samples of smokers was presented.

Keywords: Smoking, Smoker Panel, Smoking Behavior, Smoking Questionnaire, COVID-19

Table 1. The number of participants in the base survey and follow-up survey by year

| No smoking for the last 6 months or more |  |  |  |  |  |
| Yes | 5 ( 5.2) | 28 (36.8) | -31.7 | -43.4 | -20.0 |
| Daily life stress |  |  |  |  |  |
| Yes | 115 (59.6) | 107 (58.2) | 6.1 | $-3.9$ | 16.1 |
| PTEDS-Average |  |  |  |  |  |
| Less than 1.6 (no abnormality/normal) | 127 (51.6) | 87 (47.0) | 4.6 | -4.9 | 14.1 |
| 1.6 point-less than 2.5 point (lasting resentment) | 92 (37.4) | 74 (40.0) | -2.6 | -11.9 | 6.7 |
| Over 2.5 point (extremely/very Resentment) | 27 (11.0) | 24 (13.0) | -2.0 | -8.2 | 4.2 |
| Experience of feeling sad for more than two weeks |  |  |  |  |  |
| Yes | 39 (15.9) | 40 (21.7) | -5.9 | -13.4 | 1.6 |
| Health level compared to peers of the same age |  |  |  |  |  |
| Good | 53 (21.5) | 38 (20.7) | 0.9 | -6.9 | 8.7 |
| Normal | 151 (61.4) | 116 (63.0) | -1.7 | -10.9 | 7.6 |
| Bad | 42 (17.1) | 30 (16.3) | 0.8 | -6.3 | 7.9 |

Table 7. Comparison of smoking behavior among $5^{\text {th }}$ (2019), and $6^{\text {th }}$ (2020) follow-up participants as reported in the adult smoker panel (2)

| Type | $5^{\text {th }}$ follow-up Average (Standard deviation) | $\qquad$ | t | $p$-value |
| :---: | :---: | :---: | :---: | :---: |
| Average daily cigarette smoking amount (units) | 13.6 (6.8) | 13.7 (6.1) | -0.20 | 0.842 |
| Average number of days used for one bottle of liquid e-cigarette used (days) | 11.9 (10.2) | 3.4 (2.4) | 3.27 | 0.005 |
| Average daily heated cigarette smoking amount (units) | 12.2 (10.2) | 14.9 (6.3) | -1.19 | 0.238 |

[^0]:    *A follow-up survey participation rate $=$ (the number of follow-up survey participants in the year $/$ the number of cumulated base survey participants) ${ }^{*} 100$

[^1]:    *It is difficult to interpret because the upper bound of the estimated confidence interval is infinite
